As far as I know, no plug-in is currently capable of doing such things. Photoshop is limited by its interpreter to only what it knows. This invention relates to flat-screen displays and more particularly to a flat-screen display having both passive and active portions. Most flat-screen displays used today are solid-state devices such as liquid crystal displays (LCDs) or plasma displays. Such displays are made up of two glass plates with a layer of liquid crystals sandwiched between them. In the LCD, a single sheet of liquid crystals is situated between a glass plate which has transparent electrodes deposited on the surface and a glass plate which has a matrix of small, opaque electrodes. When a potential difference is applied between the transparent electrodes of the two plates, the liquid crystals rotate to form a picture. In a plasma display, on the other hand, the glass plates are coated with a phosphor substance. When the plates are bombarded by ultraviolet rays, the phosphor substance glows and emits light. An active-matrix system is usually employed with the plasma display. The active-matrix system normally employs an electrode which is addressed separately from the plasma display. The electrode is connected to a switch, which is generally an MIM (metal-insulator-metal) device. For example, in a one-line-per-cell plasma display, the electrode is addressable by a two-dimensional array of switches and a switching circuit. Passive-matrix systems are employed with liquid crystal displays. In these displays, the liquid crystals are moved by changing the potential at only one electrode as a single row or column of picture elements is turned on and off. One of the advantages of active-matrix displays is that they can have higher resolution. In addition, the electron beams which are used in cathode ray tubes have insufficient resolution. Also, a CRT is bulky. A disadvantage of active-matrix systems is that they are relatively expensive to manufacture. The cost of manufacturing active-matrix displays is due, at least in part, to the assembly operations involved in assembling the large number of components. Even in passive-matrix liquid crystal displays
