Elcomsoft Password Recovery Pro 2.5 Crack For Windows. RAR.zip Q: Making an NSArray of NSStrings more efficiently I have a lot of strings in an array. I want to go through each string and do something to it. So far I have this: for (NSString \*string in strings) { if ([self isSameCharacterInString:string length:string]) { [strString addObject:string]; } } But I have a feeling that this is going to be too slow, because I have to go through the whole array to look at each string, when I can just look at them one by one. Is there a faster way to go through the array in an efficient way? A: If you're looking for the slow way: for (NSString \*string in strings) { if ([self isSameCharacterInString:string length:string]) { [strString addObject:string]; } } That's the fastest way. But you should try to come up with a solution that will be as efficient as possible. Maybe you'll find that that's what the whole library does. Or maybe you'll find that you could extract that logic into a function that will be even more efficient. Or maybe you'll find that you can make the kind of optimization you're describing, but that it's not worth the effort. All of
