“Voc-One is a state-of-the-art tool that enables you to produce warm, natural, expressive, flexible and glottal voice in no time. Voc-One, unlike other vocal synthesizers, provides the user with completely user-selectable controls for both the processing of the glottal pulses and the production of vocal formants. Voc-One is completely software based and can thus be used with any DAW. The program is very easy to use, thanks to a user-friendly GUI and high-resolution waveform display. A powerful mastering device is included, featuring a powerful formant filtering system that is specifically designed to preserve and intensify the natural, wide-band sound. Product Guide: Voc-One 1. Interface The interface has been designed with user friendliness in mind. It features a large main window with floating options on the side, a fully zoomable waveform display, a large waveform display window and separate view and edit windows. 2. Pulses Voc-One is designed to produce pulses – although the actual sound can

be left up to you. Voc-One simulates a glottal pulse or pulses, and then uses a powerful and morphable formant filter bank to give a natural and very realistic vocal sound. The pulses are controlled separately from the rest of the sound. The user can produce pulses of any duration or choose from different waveforms. Pulses can be added in parallel to other pulses.

3. Formants Voc-One uses an advanced filter bank that is specifically designed to preserve and enhance the natural sound. Voc-One offers powerful and highly configurable formant filters to make the production of realistic vocal sound easy. The user controls the position and strength of the formants, choosing to work on formants in the range from 100 to 1000Hz.

4. Mastering Voc-One's mastering device is very powerful and flexible. It comes with a variety of tools such as frequency sweep, band pass and band reject filters, phasers, modulators, and LFOs. With Voc-One, a vocal sound can be mastered in the context of the original source audio. Voc-One also features a powerful and very flexible waveform display.

5. Real-Time Controls Voc-One is controlled via a simple visual interface. The user selects

from a large number of controls by dragging and dropping them onto

What's New in the?

Voc-One is a digital modelling system that uses a simple analogue synthesizer to simulate a glottal pulse or pulses, which are then used to control the main vocal synthesis parameters. It is a very flexible tool for vocalists as the main vocal parameters are controlled in real time by the first two microphones, which do not require predefined

settings. The synthesizer is equipped with an arpeggiator and MIDI capabilities, and can be used as a standalone unit or as a multi-effect. A Morphable Formant Filter Bank is used in Voc-One to obtain a rich and realistic, warm and flexible vocal quality. Synthesis modules:
