You can save your email in mbox format. That allows for automated email parsing and archiving tools. You can also use the thunderbird plugin (if you're using thunderbird) to get the same functionality. If your emails are in calendar format (such as Google calendar) you can export to that and use that on your phone or desktop. If you're looking for something as close to an offline option as possible, I've used email plugins that allow for offline usage but it's still not quite the same as real offline. Bonnaroo Music & Arts Festival The Other Side of The Pillow - July 6, 2013 As a child, I lived in a cul-de-sac. On a summer day, I would pick five or six friends and get in a truck or car and drive a few blocks to the top of the street. We would sit on the hood of the car and talk while our parents and the rest of the neighborhood went about their business. The trees were just beginning to show the first hints of their full glory in the fall and the hills were dotted with early-summer wildflowers. I had never seen anything like that before. It was a whole other world in the midst of my own. Even though I knew it was there, the beauty of that scene was still profoundly new to me. So it has been for much of my life. I can still remember the thrill of discovering the other side of the pillow, or better yet, a big field with no houses around. It was a whole new universe and I was captivated. It was a similar experience for my husband and I when we started our real estate business in the mid 1980s. Even though we had been immersed in the process of buying and selling real estate all our lives, we were both new to it

What's New In GMail Backup?

GMail Backup is an easy-to-use program that backs up your entire email account to a local folder. It lets you restore emails to a different Gmail account on the same email service. After starting the process, you are asked to enter your Gmail user name and password. This is followed by specifying the backup location. You can set the folder to store backups, the period to back up emails in days (from start to end), or months (from start to end). Then, simply press the Backup button and wait for the task to be completed. You can view log details in the main window while the backup is in progress. The backup can be initiated with emails present in all folders (e.g. inbox, sent, custom) and by setting the oldest and newest messages, one by one. Upon completion, you can get the backup archive either in HTML format or in ZIP file. The archive can be viewed in almost any email client, including Outlook Express, IBM Notes and Mozilla Thunderbird. The program does not store user credentials, and it does not interrupt user activity, so it is safe to use when sharing the computer with other people. Field of the Invention This invention relates to an information recording medium, and more particularly to an information recording medium in which the recording layer comprises a solid solution of an organic dye and a polymer material, an information recording method using the information recording medium, and an apparatus for recording information using the information recording medium. 2. Description of the Prior Art As the information recording medium of this type, there is known a heat mode recording medium utilizing a thermal energy, such as a heat mode recording tape, a heat mode recording paper, and a heat mode card. The recording method for the heat mode recording medium is usually a method of heating a heat mode recording layer by means of a heat pen or a laser light to form a thermal head image. Since the thermal head image is formed in the same manner as that of a printer utilizing an electrophotographic process, it has an advantage in that the apparatus for recording information is simple in structure. On the other hand, since the heat mode recording medium is in contact with a heat pen or a laser light to form a thermal head image, it has a disadvantage in that the heat mode recording medium has poor resistance to an organic solvent. As a method of solving this problem, there is proposed a method of forming an image by directly applying a heat mode recording material on a substrate by means of a thermal head. This method is disclosed in Japanese Laid-open patent No. 61-158625 and No. 61-261251. In these methods, a recording layer having a heat mode recording layer is generally formed on a substrate having a heat resistivity of 1.1.times.10.sup.7.degree. C/cm
