To describe the anatomic basis for the stability of the LMA and its clinical importance. Experimental study in a series of fresh cadavers and validated by high-speed cineradiography. Using a pencil-point optic fiber to visualize the paratraglottic space in 17 fresh adult cadavers, we precisely measured the area of paratraglottic space between the posterior hyoid and thyroid cartilage. Comparing the measurements with a preceding study from our laboratory, we determined the ideal height and length of LMA cartridges to extend the anteroposterior diameter of the paratraglottic space of 50% of its normal width. Measurements were then performed in each of six LMA sizes available for clinical use. The ideal LMA cartridge length was found to be 2.25 cm (SD, 0.16 cm) and the optimal LMA height was 1.67 cm (SD, 0.17 cm). Anatomic landmarks are necessary to stabilize the airway device during laparoscopic surgeries. The optimal size of the LMA to achieve adequate width of the paratraglottic space on its anteroposterior axis is 2.25 cm. The ability to measure and optimize the anteroposterior dimension of the paratraglottic space may have implications for the design of the LMA.Maybach Epicentre Le Mans Prototype The Maybach 35C-Meticore was the first car to use the Maybach name.
