The facility for automation is called AutoLISP or AutoLISP (Application Programming Interface). AutoLISP is a programming language that runs in AutoCAD. AutoLISP is available on the AutoLISP channel in the Application store, which allows a 3rd party application to integrate with Autodesk products to extend AutoCAD capabilities. AutoLISP was once part of the Class library, but is now part of the AutoCAD add-ons. Users can run AutoLISP applications from within AutoCAD or from within the add-ons. To run from within AutoCAD, the Autodesk application must have been installed on the computer before installing AutoCAD. AutoLISP is a very flexible language, and can be used for multiple purposes. Its goal is to simplify the programming of AutoCAD with a language that is close to the language used for programming a PC, while at the same time avoiding the performance penalties associated with the use of a visual programming language. The AutoCAD development environment is a relatively recent addition to the list of languages that have been implemented on the Windows platform, and its use is still growing. AutoLISP is written in LISP dialect, and much of its syntax is based on the language Common LISP. The language supports several special features. First, it allows one to execute other AutoCAD add-on scripts within the same session. Second, it allows an application to define a namespace and to declare variables in that namespace. Finally, it can define structures, functions and macros. Some commonly used macros are: In order to open a document, use the command: oop! odoc filename This would open a drawing document named filename. The format is oop!docfilename Another usage is: op! opdoc name of an object This would open a drawing named name, and select that drawing for editing. To see a list of all the macros, type: ? This will prompt you to enter a letter, or press F1 to display the help screen. The help screen lists all of the commands used in AutoLISP. Another common usage is to run the command: odoc! This will open a drawing for you to edit. The next command would be: op! a1d647c40b
