VolumeID For PC

VolumeID is a very lightweight utility whose main purpose is to modify volume IDs on FAT and NTFS disks, as well as on floppy devices, via a simple command line window. The program targets Windows operating systems from 9X and NT to 2000, XP and Server 2003. Although some of these OSes provide a built-in disk labeling utility (9X/NT/2K) that can easily change the volume label, modifying the ID is not possible without third-party tools. Command line usage For this purpose, you can rely on VolumeID to accomplish a proper job. It runs via command line, using one simple line that should contain the path to the application's executable (VolumeID.exe), accompanied by the drive and a user-defined ID. A short example The volume ID must be in hexadecimal format, in this form "xxxx-xxxx;" using any other format will not return the expected results. For instance, if you wish to change the ID of your D volume, the command line arguments should look like this: "VolumeID.exe D FFFF-FFFF." Special circumstances regarding NTFS drives A special case is that of the NTFS volumes. First of all, if you are working with this type of disk, it is best that you close all running applications, besides VolumeID, of course. This needs to be done because Windows NT might associate the modifications with a FAT volume, which may lead to a series of errors. However, if the only running application is VolumeID, these issues will not be encountered. Also, on NTFS drives, the changes will become visible as soon as a system reboot is performed. For FAT drives, there are no special requirements, although it is recommended that you cease all computer related activities once you launch VolumeID. A last evaluation On an ending note, VolumeID is a great companion for changing volume IDs on FAT and NTFS volumes, especially that everything can be achieved with a simple line of code inside the command prompt. However, there are plenty of other similar products that also have a GUI to help beginners use it.Q: WPF SelectedIndex is not working In the below code, selectedIndex.value is not changing the background color of tabitem when i select any item from the list. Programmed and designed by Game By Mouth (or the artists who programmed it). Technical Review: Clipping True to name, the result of being clipped is when the game's sprite size, in terms of pixels, is too small to fit everything on the screen. If you've ever seen a trailer for a game, you know that the logo is often clipped; while the game itself is often bigger than the screens shown. This is not the case here; in fact, sometimes the game is smaller than the screen itself. In the game's case
