Sometimes, the motherboard identification label can be found on the side of the motherboard. The effect of nanosilver on growth, development, and antioxidant capacity of developing gill cells in zebrafish (*Danio rerio*). Silver nanoparticles (AgNPs) are mostly applied as antimicrobial agents and their application as biocides in other industry, agriculture, and environment is growing. However, little is known about AgNPs effects on zebrafish (*Danio rerio*). This study evaluated the effect of AgNPs on the development and the antioxidant capacity of developing gill cells. Zebrafish were treated with four concentrations of AgNPs (0.1, 0.3, 1, and 3 $\mu\text{g}/\text{mL}$) from 4 to 24-h post fertilization. AgNPs concentrations above 0.1 $\mu\text{g}/\text{mL}$ affected the development of zebrafish in a concentration-dependent manner. At 24 h post fertilization, AgNPs at the concentration of 3 $\mu\text{g}/\text{mL}$ significantly decreased the body length ($P = 0.031$) and the body weight ($P = 0.048$). AgNPs significantly affected the size of gill arches, Hsp70, and catalase activity of the gills at all Ag f30f4ceada
