It provides an interface to install and uninstall packages, yast2inf is also able to offer suggestions on package installations, what must be installed before the suggested package can be installed. YaST (Xandros) YaST is the Linux distribution from the Xandros Project. YaST offers a simple interface to perform administrative tasks. The project is focused on the needs of Linux administrators, and this is reflected in YaST's philosophy of simplicity and minimalism. YaST has its own package management system called Build Service. This system relies on both package descriptors in YaST's database and the manifest files in each package. Concepts The YaST repository contains binary packages for three different types of packages: Plugins, Extensions and Extensions. Plugins are Extensions for YaST. They are installed with YaST and control the installation and the running of other Extensions. Extensions are libraries or programs that may be used to extend YaST. They may be installed from source in the yast.sources repository, or they may be found in the binary repository. Extensions are installed with YaST using the Install Extension wizard. The YaST database is structured as follows: Plugins The Plugins directory contains plugin descriptors, which are used to control the installation and running of the Plugins. The plugin descriptors include the package name, the location of the Plugin description and the required prerequisites for installing the Plugin. The plugin descriptors are installed with YaST and control the installation and running of the Plugins. Extensions The Extensions directory contains extension descriptors 77a5ca646e
