In this video .Electromagnetic fields in occupational settings: a review of the evidence. Electromagnetic fields and associated metal ions have the potential to be the cause of some health effects in animals and man. In this paper, based on a systematic literature review, we describe the state of the evidence regarding occupational exposure to such agents. All published experimental and epidemiological studies examining the effects of occupational exposure to electromagnetic fields or metal ions were identified from electronic and hand searches. Systematic reviews were performed. The strength of evidence relating to health effects was assessed using criteria set out in the Report of the International Agency for Research on Cancer. Of 87 studies which met the inclusion criteria, 44 were experimental, and the remainder were case-control and cohort studies. There were 12 systematic reviews or summaries available, and, of these, six suggested that there was evidence of health effects. The remaining six systematic reviews did not reach any firm conclusions on the health effects of electromagnetic fields. Of the experimental studies, eight were positive, nine were negative, and 23 were equivocal. The majority of studies considered exposure to power-frequency magnetic fields as being of unknown risk. Observational studies showed only weak evidence of associations between occupational exposure to electromagnetism and increased risk of cancer of the breast, and of lymphomas. There was some limited evidence of increased risks of death from all causes and from cardiovascular diseases among those occupationally exposed to EMF. The evidence of positive associations between exposure to power-frequency magnetic fields and cancer 1cb139a0ed
